

TRIAGE-LINK — Commercialization: Options & Decision Guide

Read this first. You wanted to explore *all* the options before committing. This page is the map: the deliverables now in the repo, the real decisions in front of you, and how the documents inform each. Nothing here locks you in — it's built to help you choose.

Prepared 2026-06-27.

The documents (the exploration set)

Doc	Answers	Read it when deciding...
<code>commercialization-strategy.md</code>	Who buys, how to win, business model/pricing, phased commercial roadmap; scores all four beachheads (§4)	... which market and how to make money
<code>productization-gap-backlog.md</code>	The engineering prototype→product gaps, sized & sequenced , with the tier each unlocks	... what it costs to build and in what order
<code>regulatory-privacy-brief.md</code>	Medical-device vs documentation-tool decision; PHIPA/PIPEDA/residency; security controls	... how heavy the compliance load is for each path
<code>canada-market-survey.md</code>	The competitive landscape + regulatory moat (background)	... who you're up against
<code>CERTIFICATION-ROADMAP.md</code>	The full SaMD certification path (background)	... the regulated-market endgame

The three decisions that drive everything

Decision A — Intended use (*regulatory brief*)

Documentation/coordination tool (light, months to revenue) **vs SaMD** (heavy, 12–24+ months). Everything downstream traces to this. *Recommended for a first move: documentation tool.*

Decision B — Beachhead market (*strategy §4*)

Option	Fit with our strengths	Accessibility	Reg. load	Revenue horizon
Humanitarian / NGO / global health	★★★	★★	light	months
Disaster / MCI & event medicine	★★★	★★★	light-med	months
Training / simulation (entry wedge)	★★	★★★	lightest	months
Official EMS (provincial/municipal)	★	★	heavy	12-24+ months

Trade-off in one line: the niche segments **fit our differentiation and are reachable fast**; official EMS is **the biggest prize but a fortress** (OADS moat, entrenched cloud incumbents, the Prehos refugees still choosing cloud).

Decision C — Licensing posture (*strategy §6*)

Repo is **MIT** today. A commercial product usually moves to **open-core / dual-license** (free core, paid org/compliance/support features). Decide before customer deployments and external contributions accrue.

How the options combine (illustrative paths)

Path	Intended use	Beachhead	Build load	When to revisit regulation
A. Niche-first (<i>recommended</i>)	Documentation tool	Humanitarian + disaster/event	P1 only (no XL items)	Phase 3, if/when chasing EMS
B. Training wedge	Documentation tool	Training/simulation → niche	Smallest P1	Later
C. EMS frontal	SaMD	Official provincial/municipal EMS	P1+P2+P3 (incl. OADS/NEMSIS, SaMD)	Now — it's the whole point
D. Hybrid	Tool now, SaMD later	Niche now, EMS later	P1 now; P3 deferred	Staged

What I'd recommend (you can override)

Path A / D — niche-first, documentation tool, open-core, anchored on humanitarian + disaster/event, with EMS as a deliberate Phase-3 expansion. It matches

the product's actual edge, reaches revenue in months, and keeps the expensive regulated work optional until there's proof and funding. The full case is in

`commercialization-strategy.md`.

But the docs are written so you can also justify **Path C** (go straight at EMS) if you have the capital, regulatory appetite, and a multi-year horizon — the survey and cert roadmap lay out exactly what that costs.

Once you've chosen — next steps

- **Picked a beachhead?** → I can deep-dive a single-segment GTM plan (buyer personas, pilot targets, pricing, outreach).
- **Picked the engineering path?** → I can turn the gap backlog into a sequenced, estimated delivery plan (or start building P1 items).
- **Going for EMS/regulated?** → I can expand the cert roadmap into an actionable QMS + OADS/NEMSIS conformance plan.
- **Still weighing it?** → tell me which two paths you're torn between and I'll do a focused head-to-head.
